

GMP compliant handling of raw data in the environment of chemical analytics

Availability

High Availability (HA) results from the initial design or you need a redesign.

HA can only be achieved if you have a good design, good tools (NT/Unix based tools are not sufficient), a test system and a well trained operating staff.

>90 Percent of all commercially available LIM Systems do not support HA in a sufficient way. (Except for marketing propose.)

Working Hardware and Software Change Control systems are the key to real live high availability for these systems.
